

JobApply AI — Project Handover

What This Project Is

A smart job application agent that interviews you once about your experience and skills, then applies to many jobs on your behalf — fully tailored per job, fully tracked.

The Funnel

Interview → Auto-Screen & Score → Shortlist → Tailor & Generate → Apply → Track Outcome

Architecture

1. Interview Bot

- Conversational AI (Claude) that extracts a structured candidate profile
- Asks one question at a time, fills gaps across multiple sessions
- Saves profile as `candidate/profile.json` and session transcripts to `candidate/interviews/`

2. Job Discovery & Screening

- Searches job boards (Adzuna API — free tier) based on candidate preferences
- Scores each listing against the candidate profile (match score 0–100)
- Logs all screened jobs to `job_screenings/` with status: `screened` | `shortlisted` | `skipped`
- Full funnel visibility: e.g. 40 screened → 10 shortlisted → 6 applied → 2 interviews

3. Application Generator

- For each shortlisted job: tailors CV + cover letter using Claude
- Saves to `applications/[app_id]/` with `cover_letter.md`, `cv_tailored.md`,

meta.json

4. Central Tracker (`tracker.json`)

- Single source of truth / memory of the entire system
 - Logs: interview sessions, job screenings, applications, outcomes
 - Read at the start of every session so nothing is repeated
-

Folder Structure (GitHub Repo: `jobapply-ai`)

```
jobapply-ai/
├── tracker.json
├── PLAN.md
├── candidate/
│   ├── profile.json
│   └── interviews/
│       ├── session_001.md
│       └── session_002.md
├── job_screenings/
│   ├── screening_log.json
│   └── details/
│       ├── job_001_acme_engineer.json
│       └── job_002_stripe_pm.json
├── applications/
│   └── app_001_acme_engineer/
│       ├── cover_letter.md
│       ├── cv_tailored.md
│       └── meta.json
└── question_bank/
    └── questions.json
```

tracker.json Schema

```
{
  "candidate": {
    "name": "",
    "last_interview_session": "",
    "profile_completeness": 0,
    "known_gaps": []
  }
}
```

```

},
"interview_sessions": [
  {
    "id": "session_001",
    "date": "",
    "topics_covered": [],
    "skills_extracted": [],
    "gaps_identified": []
  }
],
"job_screenings": [
  {
    "id": "job_001",
    "title": "",
    "company": "",
    "source_url": "",
    "date_screened": "",
    "match_score": 0,
    "status": "screened | shortlisted | skipped"
  }
],
"applications": [
  {
    "id": "app_001",
    "job_id": "job_001",
    "date_drafted": "",
    "date_sent": "",
    "method": "manual | auto",
    "status": "drafted | sent | interview_requested | rejected | offer",
    "notes": ""
  }
],
"question_bank_version": "1.0"
}

```

question_bank/questions.json

Stores which interview questions are most effective for which job categories. So the system learns over time — e.g. engineering roles need different questions than marketing roles.

```

{
  "version": "1.0",
  "categories": {},
  "created": ""
}

```

}

Tech Stack

Layer	Choice
AI backbone	Claude API (claude-sonnet-4-20250514)
Storage	GitHub repo (<code>jobapply-ai</code> , private)
Job listings	Adzuna API (free tier)
Frontend	React artifact (Claude.ai) or Claude Code CLI

Where We Left Off

-  Full project scope defined
 -  Folder structure and tracker schema designed
 -  React artifact built (interview bot + Drive setup) — needs to be ported to GitHub instead of Google Drive
 -  GitHub repo not yet created
 -  Interview not yet run — no candidate profile exists yet
 -  Job screening and application generator not yet built
-

Next Steps (in order)

1. Create private GitHub repo called `jobapply-ai`
2. Initialize folder structure and commit `tracker.json` , `PLAN.md` ,
`question_bank/questions.json`
3. Build the interview bot in Claude Code — reads `tracker.json` first, asks only for missing info, saves profile + session transcript to repo
4. Build job screener — takes candidate profile + search preferences, calls Adzuna API,

scores and logs results

5. Build application generator — takes job description + profile, generates tailored CV + cover letter, saves to `applications/`

How to Start Next Claude Code Session

Open Claude Code in the `jobapply-ai` folder and say:

"I'm continuing the JobApply AI project. Read HANDOVER.md for full context. Let's start by initializing the repo structure and then building the interview bot."
